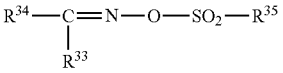
Preferable examples of the oxime sulfonate-based acid generator include compounds represented by general formula (B-2) or (B-3) shown below.

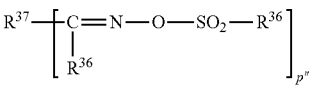
[Chemical Formula 98]



(B-2)

In the formula (B-2), R^{33} represents a cyano group, an alkyl group having no substituent or a halogenated alkyl group; R^{34} represents an aryl group; and R^{35} represents an alkyl group having no substituent or a halogenated alkyl group.

[Chemical Formula 99]



(B-3)

In the formula (B-3), R^{36} represents a cyano group, an alkyl group having no substituent or a halogenated alkyl group; R^{37} represents a divalent or trivalent aromatic hydrocarbon group; R^{38} represents an alkyl group having no substituent or a halogenated alkyl group; and p" represents 2 or 3.

In general formula (B-2), the alkyl group having no substituent or the halogenated alkyl group for R^{33} preferably has 1 to 10 carbon atoms, more preferably 1 to 8 carbon atoms, and most preferably 1 to 6 carbon atoms.

As R^{33}, a halogenated alkyl group is preferable, and a fluorinated alkyl group is more preferable.

The fluorinated alkyl group for R^{33} preferably has 50% or more of the hydrogen atoms thereof fluorinated, more preferably 70% or more, and most preferably 90% or more.

Examples of the aryl group for R^{34} include groups in which one hydrogen atom has been removed from an aromatic hydrocarbon ring, such as a phenyl group, a biphenyl group, a fluorenyl group, a naphthyl group, an anthryl group, and a phenantryl group, and heteroaryl groups in which some of the carbon atoms constituting the ring(s) of these groups are substituted with hetero atoms such as an oxygen atom, a sulfur atom, and a nitrogen atom. Of these, a fluorenyl group is preferable.

The aryl group for R^{34} may have a substituent such as an alkyl group of 1 to 10 carbon atoms, a halogenated alkyl group, or an alkoxy group. The alkyl group and halogenated alkyl group as the substituent preferably has 1 to 8 carbon atoms, and more preferably 1 to 4 carbon atoms. Further, the halogenated alkyl group is preferably a fluorinated alkyl group.

The alkyl group having no substituent or the halogenated alkyl group for R^{35} preferably has 1 to 10 carbon atoms, more preferably 1 to 8 carbon atoms, and most preferably 1 to 6 carbon atoms.

As R^{35}, a halogenated alkyl group is preferable, and a fluorinated alkyl group is more preferable.

In terms of enhancing the strength of the acid generated, the fluorinated alkyl group for R^{35} preferably has 50% or more of the hydrogen atoms fluorinated, more preferably 70% or more, still more preferably 90% or more. A completely fluorinated alkyl group in which 100% of the hydrogen atoms are substituted with fluorine atoms is particularly desirable.

In general formula (B-3), as the alkyl group having no substituent and the halogenated alkyl group for R^{36}, the same alkyl group having no substituent and the halogenated alkyl group described above for R^{33} can be used.

Examples of the divalent or trivalent aromatic hydrocarbon group for R^{37} include groups in which one or two hydrogen atoms have been removed from the aryl group for R^{34}.

As the alkyl group having no substituent or the halogenated alkyl group for R^{38}, the same one as the alkyl group having no substituent or the halogenated alkyl group for R^{35} can be used.

p" is preferably 2.
